

Product Bulletin

Doc. No. GPM-SS-B-0036

Date: January 5th, 2025

Product ref: Flashing & Floor Planking Modification Release

Comm: STANDARD

Overview

To continue to improve the St.Boniface Aeration system (Floor planks & Flashing) a design/installation review was completed. After multiple physical tests it was found that if we increase the gauge of flashing, the number of planks cut at site could be minimized. On average across all of the sizes, the number of planks cut decreases by 75%. This is significant, especially on the larger bins.

Product Information

The floor planks remain unchanged. Continued to be offered in 20-gauge, Canola .054 perforation & Cereal .094 perforation.

Both the slit/non-slit floor flashing material thickness was increased from .028" min to .036" min, and strength from CS TYPE B to GR40.

Effectivity date: October 15, 2024.

Contact your local sales representative for further information and pricing.
